Summary

Suggested Readings

The preceding two chapters dealt with contemporary grand theories of large-scale changes in the social world. In this chapter we remain focused on contemporary theories, but this time those that are oriented to a variety of small-scale phenomena associated with everyday life. We begin with symbolic interactionism, a theory strongly influenced by the thinking of George Herbert Mead (see Chapter 3). This is followed by an examination of dramaturgy that sees much of social life as analogous to a theatrical performance. Ethnomethodology is concerned with the methods we all use regularly to accomplish our lives on a daily basis. Next is exchange theory that looks at social relationships in terms of rewards and costs and argues, among other things, that we are likely to continue in relationships that are rewarding and discontinue those that are costly. Finally, we discuss rational choice theory that focuses on actors making choices that maximize the satisfaction of their needs and wants.

SYMBOLIC INTERACTIONISM

The focus of **symbolic interactionism**, like the other theories discussed in this chapter, is on everyday life. Its distinctive focus, as its name suggests, is on

symbolic interactionism The school of sociology that, following Mead, focused on symbolic interaction.

interaction (as well as action and people as agents) and the symbols (and their meanings) that are deeply implicated in it. We can get a handle on this theory by enumerating some of its most fundamental assumptions and principles.

First, people act toward things, but they do so on the basis of the meanings those things have for them. Thus, we act toward the American flag, say by saluting it, based on the meaning that flag has for us (our homeland) and not simply on its physical characteristics. This also means that others can act toward it in other ways (say, by burning or defacing it) because it has other meanings (a symbol of U.S. imperialism) for them.

Second, these meanings stem from our interactions with other people. Thus, we may have learned about the flag as a positive symbol through interactions at school while enemies of the United States may have learned theirs through interactions with groups of revolutionaries.

Third, people do not simply internalize the meanings that they learn through social interaction, but they are also able to modify them through an interpretive process. Thus, while one may have learned to see the flag as a positive symbol, dissatisfaction with, say, America's foreign policies might lead one to reinterpret the flag and to feel a bit less positive toward, or even develop negative sentiments about, it and what it stands for. Conversely, those who develop negative views in a revolutionary cell, may become more positive about the flag and what it symbolizes as a result of U.S. actions that satisfy some of the revolutionaries' demands.

Fourth, people, in contrast to other animals, are unique in their ability to use and rely on symbols. While other animals react directly or blindly to stimuli, people are able to give them meaning (turn them into symbols) and then act on the basis of that meaning. To put this another way, other animals react instinctively to objects, while we think through their meaning. Thus, a hungry animal might eat a poison mushroom, but we would be able to think through the fact that we had better not eat it because it might be poisonous.

Fifth, people become human through social interaction, especially in the early years with family members and then in school. We are born with the capacities to become human, but that potential can only be realized through human interaction. Thus, feral children—those raised in the wild by animals (e.g., wolves)—cannot become human, but begin to become human when they are rescued and begin to interact with other humans.

Sixth, as George Herbert Mead made clear (see Chapter 3), people are conscious, capable of reflecting on themselves and what they do, and therefore capable of shaping their actions and interactions. In Mead's terms, then, people have both a "mind" and a "self." Particularly important is our ability to interact with ourselves in order to decide how to interact with objects in our world. This gives us a large measure of autonomy in our actions, but we certainly are not totally free to do as we wish—there are many external constraints on our actions.

Seventh, people have purposes when they act in, as well as toward, situations. We define situations, give them meaning, and then act toward them. We

Key Concepts

The Conceptual Contributions of Charles Horton Cooley

Charles Horton Cooley (1864–1929) is best known for his concept of the **looking-glass self**. We form our sense of ourselves by looking in some sort of mirror. That mirror is the other people with whom we interact. We use others as mirrors to assess who we are and how we are doing. We look at their eyes and their body language and we listen to their words. Looking in that mirror, we determine whether we are who we want to be and whether our actions are having the desired effect. If we see what we expect to see, if people evaluate us the way we hope, if they do what we want them to do, then the mirror confirms ourselves and we continue on as we have been thinking and acting. However, if the reverse occurs, then we may need to reassess our actions and even our sense of who we are. If the looking glass continues to show us a reflection that is different from what we think we are, then we may need to re-evaluate our sense of who we are, in other words, re-evaluate our self-images. The looking-glass self reflects Cooley's interest, like that of others associated with symbolic interactionism, in the mind, self, and interaction.

Another key concept associated with Cooley is the **primary group**, an intimate face-to-face group that plays a crucial role in linking the individual to the larger society. Of special importance are the primary groups of the young, mainly the family and friendship groups, within which the individual grows into a social being. It is mainly within the primary group that the looking-glass self develops and the child makes the transition from thinking mainly about himself to taking others into consideration. As a result of this transformation, the child begins to develop the capabilities that will enable him to become a contributing member of society.

Cooley also made an important methodological contribution arguing for the need for sociologists to put themselves in the place of the actors they were studying (usually in the real world) in order to better understand the operation of their mental processes. Cooley called this **sympathetic introspection**—putting oneself in the places and the minds of those being studied, doing so in a way that is sympathetic to who they are and what they are thinking, and trying to understand the meanings and the motives that lie at the base of their behavior. This method continues to be one of the cornerstones of the study of everyday life, at least for some sociologists.

Robert E. Park (1864–1944)

A Biographical Vignette

Robert Park did not follow the typical career route of an academic sociologist: college, graduate school, professorship. Instead, he led a varied career before he became a sociologist late in life. Despite his late start, Park had a profound effect on sociology in general and on theory in particular. Park's varied experiences gave him an unusual orientation to life; this view helped to shape the Chicago school, symbolic interactionism, and, ultimately, a good portion of sociology.

Park was born in Harveyville, Pennsylvania, on February 14, 1864. As a student at the University of Michigan, he was exposed to a number of great thinkers, such as John Dewey. Although he was excited by ideas, Park felt a strong need to work in the real world. Park said, "I made up my mind to go in for experience for its own sake, to gather into my soul . . . all the joys and sorrows of the world." Upon graduation, he began a career as a journalist, which gave him this real-world opportunity. He particularly liked to explore (hunting down gambling houses and opium dens). He wrote about city life in vivid detail. He would go into the field, observe and analyze, and finally write up his observations. Essentially, he was already doing the kind of research (scientific reporting) that came to be one of the hallmarks of Chicago sociology: urban ethnology using observation techniques.

Although the accurate description of social life remained one of his passions, Park grew dissatisfied with newspaper work because it did not fulfill his familial or, more important, his intellectual needs. Furthermore, it did not seem to contribute to the improvement of the world, and Park had a deep interest in social reform. In 1898, at age 34, Park left newspaper work and enrolled at Harvard.

choose ends and then act toward them (although not always successfully or in a linear manner since we may encounter all sorts of barriers and roadblocks).

Eighth, we can see society as consisting of people engaging in social interaction. Thus, society is not some macro-level entity separable from people. People produce society; society is the joint action of people.

There is, of course, much more to symbolic interactionism than this, but this brief overview, as well as the earlier, more detailed discussion of Mead's ideas, should give the reader a sense of this theoretical perspective.

However, one more basic point needs to be made before we move on. Symbolic interactionists are inclined to do social research rather than to develop abstract theories. This means they often go out and study people and get at their meanings from their point of view. To do so means they must often venture into the real world and observe and interact with people.

A key figure in this tradition of social research in the real world is Robert E. Park (1864–1944). Park had been a reporter before becoming a sociologist, and as a reporter he was accustomed to collecting data on and observing whatever social reality he was writing about. When he became a sociologist, Park urged his students as well as colleagues to do much the same thing. In one sense, he

was encouraging them to do what has come to be known as **fieldwork**: that is, venturing into the field to observe and collect relevant data. More specifically, as a result of the urging of Park (and others), the key method of symbolic interactionists became **observation**. The attraction of being an observer is that researchers can both engage in sympathetic introspection and put themselves in the place of actors to try to understand their meanings and motives and observe the various actions that people take. Thus, observation was a perfect way for those associated with symbolic interactionism to study the thought processes, the actions, and the interactions of everyday life.

DRAMATURGY

The concept of self is very important to, and lies at the heart of, symbolic interactionism. Herbert Blumer defined the self in extremely simple terms as the fact that people can be the objects of their own actions: that is, people have the ability to act not only toward others, but also toward themselves (e.g., by admonishing themselves for saying something foolish). Both types of actions are based on the kinds of objects people are to themselves (e.g., whether they look upon themselves in a positive or negative light). Being able to do this, to act toward themselves, allows people to act in a conscious manner rather than merely reacting to external stimuli. People actually interact with themselves to point out the things toward which they are acting and the meaning of those things. They interpret the meaning of things and alter those interpretations on the basis of the situation they are in and what they hope to accomplish.

The most important work on the self in symbolic interactionism is *Presentation of Self in Everyday Life* by Erving Goffman. Goffman's conception of the self is deeply indebted to Mead's (see Chapter 3) ideas, in particular his discussion of the tension between *I*, the spontaneous self, and *me*, social constraints within the self. This tension is mirrored in Goffman's work on what to him was a critical discrepancy between our all-too-human selves on the one hand and our socialized selves on the other. The tension results from the difference between what we may want to do spontaneously and what people expect us to do. We are confronted with demands to do what is expected of us; moreover, we are not

fieldwork A methodology used by symbolic interactionists and other sociologists that involves venturing into the field (the day-to-day social world) to observe and collect relevant data.

observation A methodology closely related to fieldwork, in which the symbolic interactionist (and other sociologists) studies the social world by observing what is transpiring in it. In the case of symbolic interactionism, this enables researchers to engage in sympathetic introspection and put themselves in the place of actors in order to understand meanings and motives and to observe the various actions that people take.

supposed to waver. In order to cope with this tension and to maintain a stable self-image, people perform for their social audiences. As a result of this interest in performance, Goffman focused on **dramaturgy**, or a view of social life as a series of dramatic performances akin to those performed in the theater.

Dramaturgy

Goffman's sense of the self was shaped by his dramaturgical approach. To Goffman (and to most other symbolic interactionists), the self is not a possession of the actor but rather the product of the dramatic interaction between actor and audience. In other words, the **self** is a sense of who one is that is a dramatic effect emerging from the immediate scene being presented. Because the self is a product of dramatic interaction, it is vulnerable to disruption during the performance. Much of Goffman's dramaturgy is concerned with the processes by which such disturbances are prevented or dealt with. Although the bulk of his discussion focuses on these dramaturgical contingencies, Goffman pointed out that most performances are successful. The result is that in ordinary circumstances a firm self is accorded to performers, and it appears to emanate from the performers.

Goffman assumed that when individuals interact, they want to present a certain sense of self that will be accepted by others. However, even as they present that self, actors are aware that members of the audience can disturb their performance. For that reason actors are attuned to the need to control the audience, especially those members of it who might be disruptive. The actors hope that the sense of self that they present to the audience will be strong enough for the audience to define the actors as the actors want to be defined. The actors also hope that this will cause the audience to act voluntarily as the actors want them to. Goffman characterized this central interest as **impression management**. It involves techniques actors use to maintain certain impressions in the face of problems they are likely to encounter and methods they use to cope with these problems.

Front Stage Following the theatrical analogy, Goffman spoke of a **front stage**, that part of the performance that generally functions in rather fixed and general

ways to define the situation for those who observe the performance. A professor lecturing to a class may be said to be in her front stage, as would a student at a fraternity party. Within the front stage, Goffman further differentiated between the setting and the personal front. The **setting** refers to the physical scene that ordinarily must be there if the actors are to perform. Without it, the actors usually cannot perform. For example, a surgeon generally requires an operating room, a taxi driver a cab, and an ice skater an ice rink. The **personal front** consists of those items of expressive equipment that the audience identifies with the performers and expects them to carry with them into the setting. A surgeon, for instance, is expected to dress in a medical gown, have certain instruments, and so on.

Goffman subdivided the personal front into appearance and manner. **Appearance** includes those items that tell us the performer's social status (e.g., the taxi driver's license). **Manner** (e.g., the expression of confidence on the surgeon's face) tells the audience what sort of role the performer expects to play in the situation. A brusque manner and a meek manner indicate quite different kinds of performances. In general, we expect appearance and manner to be consistent.

Although Goffman approached the front and other aspects of his system as a symbolic interactionist, he did discuss their structural character. He argued that fronts tend to become institutionalized, so collective representations arise about what is to go on in a certain front. Very often when actors take on established roles, they find particular fronts already established for such performances. The professor who appears before a class has a front that has been established by many professors and students who have come before her. The result, Goffman argued, is that fronts tend to be selected, not created. This idea conveys a much more structural image than we would receive from most symbolic interactionists.

Despite such a structural view, Goffman's most interesting insights lie in the domain of interaction. He argued that because people generally try to present an idealized picture of themselves in their front-stage performances, inevitably they feel that they must hide things in their performances:

1. Actors may want to conceal secret pleasures engaged in prior to the performance (e.g., the professor who consumed alcohol just before entering class) or in past lives (e.g., physicians who had been drug addicts but had overcome their addiction) that are incompatible with their performance.

appearance The way the actor looks to the audience; especially those items that indicate the performer's social status.

manner The way an actor conducts himself; tells the audience what sort of role the actor expects to play in the situation.

Key Concept
Role Distance

Another of Goffman's interests was the degree to which an individual embraces a given role. In his view, because of the large number of roles, few people get completely involved in any given role. **Role distance** deals with the degree to which individuals separate themselves from the roles they are in. For example, if older children ride on a merry-go-round, they are likely to be aware that they are really too old to enjoy such an experience. One way of coping with this feeling is to demonstrate distance from the role by, in a careless, lackadaisical way, performing seemingly dangerous acts while on the merry-go-round. In performing such acts, the older children are really explaining to the audience that they are not as immersed in the activity as small children might be or that if they are, it is because of the special things they are doing.

One of Goffman's key insights is that role distance is a function of one's social status. High-status people often manifest role distance for reasons other than those of people in low-status positions. For example, a high-status surgeon may manifest role distance in the operating room to relieve the tension of the operating team. People in low-status positions usually manifest more defensiveness in exhibiting role distance. For instance, people who clean toilets may do so in a lackadaisical and uninterested manner. They may be trying to tell their audience that they are too good for such work.

2. Actors may want to conceal errors made in the preparation of the performance as well as steps taken to correct these errors. For example, a surgeon may seek to hide the fact that he prepared to do an appendectomy when, in fact, he was scheduled to do open heart surgery. A professor who brings the wrong notes to class may be forced to improvise during the class period in order to conceal that fact.
3. Actors may find it necessary to show only end products and to conceal the process involved in producing them. For example, professors may spend several hours preparing a lecture, but they may want to act as if they have always known the material.
4. It may be necessary for actors to conceal from the audience that dirty work was involved in the making of the end products. Dirty work may include doing things that are immoral, illegal, or degrading. For example, a manufacturer of peanut butter may seek to conceal from government inspectors the fact that an inordinate number of rodent droppings and rodent hairs found their way into the finished product.
5. In giving a certain performance, actors may have to let other standards slide. For example, in order to keep up with a busy surgical schedule, the

surgeon may not be able to find the time to do enough reading to keep up with recent developments in his field.

6. Finally, actors probably find it necessary to hide any insults, humiliations, or deals made so that the performance could go on. A surgeon may well want to hide the fact that he has been admonished by his superiors for not keeping up with recent developments and that he will be suspended if he does not demonstrate that he is reducing his surgical schedule so that he has time to do so.

Generally, actors have a vested interest in hiding all of the facts discussed from their audience.

Another aspect of dramaturgy in the front stage is that actors often try to convey the impression that they are closer to the audience than they actually are. Actors may try to foster the impression that the performance in which they are engaged at the moment is their only performance or at least their most important one. Thus, a physician must try to convey the impression to every patient that he or she is *the* most important patient and the object of her undivided attention. To do this, actors have to be sure that their audiences are segregated so that the falsity of the performance is not discovered. The physician's patients would be upset to learn that an effort is made by the doctor to make each one of them feel as if he or she is the most important patient. Even if it is discovered, Goffman argued, the audiences themselves may try to cope with the falsity, to avoid shattering their idealized image of the actor. Thus, patients may console themselves with the fact that that's the way doctors are and, in any case, the doctor does excellent work. This reveals the interactional character of performances. A successful performance depends on the involvement of all the parties.

Another example of this kind of impression management is an actor's attempt to convey the idea that there is something unique about this performance as well as his or her relationship to the audience. Thus, a car salesperson may seek to convey the idea that he really likes a particular customer and is giving her a far better deal than he would give anyone else. The audience, too, wants to feel that it is the recipient of a unique performance. Car buyers want to feel that their salesperson is not giving them the same old spiel and that they have a special relationship with the salesperson.

Actors try to make sure that all the parts of any performance blend together. A priest might seek to ensure consistency and continuity among his Sunday sermons. In some cases, a single discordant aspect can disrupt a performance. However, performances vary in the amount of consistency required. A slip by a priest on a sacred occasion would be terribly disruptive, but if a taxi driver made one wrong turn, it would not be likely to damage the overall performance greatly.

Another technique employed by performers is **mystification**. Actors often tend to confound their audience by restricting the contact between themselves

role distance The degree to which individuals separate themselves from the roles they are in.

mystification An effort by actors to confound their audience by restricting the contact between themselves and the audience, concealing the mundane things that go into their performance.

and the audience. They do not want the audience to see the very mundane things that go into a performance. Thus, a professor may prepare a lecture by simply reading a textbook not being used in a particular class, but she will certainly conceal this fact and attempt to act as if she has known this material and much else for a long time. By generating social distance between themselves and the audience, actors try to create a sense of awe in the audience. Students are supposed to be awed by how much a professor knows and how effortlessly a mass of information can be brought to bear on a particular lecture. This awe, in turn, keeps the audience from questioning the performance. Goffman pointed out that the audience is involved in this process and often seeks to maintain the credibility of the performance by keeping its distance from the performer. In the case being discussed here, students would not want to know how the professor prepares for class because it would demystify the whole process.

Goffman also had an interest in teams. To Goffman, as a symbolic interactionist, a focus on individual actors obscured important facts about interaction. Thus, Goffman's basic unit of analysis was not the individual but the team. A **team** is any set of individuals who cooperate in staging a single routine. The preceding discussion of the relationship between the performer and audience is really about teams. Each member is reliant on the others because all can disrupt the performance and all are aware that an act is being put on. Goffman concluded that a team is a kind of secret society. A class is such a secret society and class members cooperate with the professor in making each class a credible performance. Of course, at times a professor makes so many slips, or reveals so many weaknesses, that the students can no longer ignore them and the performance is disrupted, if not destroyed. However, this a rarity and something students and professors, audiences and performers, seek to avoid at all costs.

Back Stage and Outside Goffman also discussed a **back stage**, where facts suppressed in the front stage or various kinds of informal actions may appear. A back stage is usually adjacent to the front stage, but it is also cut off from it. Performers can reliably expect no members of their front audience to appear in the back. Furthermore, they engage in various types of impression management to make sure of this. A performance is likely to become difficult when actors are unable to prevent the audience from entering the back stage. The doctors' lounge is the back stage relative to the office where physicians interact with patients. Safely in the back stage lounge, doctors can say things about their patients, their expertise, or their performance that they would never say to patients in the front stage. A doctor would rarely, if ever, tell a patient that she dislikes him, has no idea what ails him, or what to do about it.

team Any set of individuals who cooperate in staging a single performance.

back stage Where facts suppressed in the front stage or various kinds of informal actions may appear. A back stage is usually adjacent to the front stage, but it is also cut off from it. Performers can reliably expect no members of their front audience to appear in the back.

Key Concept *Stigma*

Goffman was interested in *stigma*, or the gap between what a person ought to be, **virtual social identity**, and what a person actually is, **actual social identity**. **Stigma** involves a gap between virtual and actual social identity. Goffman focuses on the dramaturgical interaction between stigmatized people and normals. The nature of that interaction depends on which of two types of stigma an individual has. In the case of **discredited stigma**, the actor assumes that the differences are known by the audience members or are evident to them (e.g., a paraplegic or someone who has lost a limb). A **discreditable stigma** is one in which the differences are neither known by audience members nor perceivable by them (e.g., a person who has had a colostomy or a homosexual passing as straight). For someone with a discredited stigma, the basic dramaturgical problem is managing the tension produced by the fact that people know of the problem. For someone with a discreditable stigma, the dramaturgical problem is managing information so that the stigma remains unknown to the audience.

Most of the text of Goffman's *Stigma* is devoted to people with obvious, often grotesque, stigmas (e.g., the loss of a nose). However, as the book unfolds, the reader realizes that Goffman is really saying that we are all stigmatized at some time or other, or in some setting or other. His examples include the Jew passing in a predominantly Christian community, the fat person in a group of people of normal weight, and the individual who has lied about his past and constantly must be sure that the audience does not learn of this deception.

A third, residual domain is the **outside**, which is neither front nor back. For example, a brothel is (usually) outside, relative to the doctor's office and lounge. However, it is possible that a brothel could become a back stage if it is visited by doctors or patients who then bend the ear of the hooker by complaining about each other.

The latter illustrates the idea that *no* area is *always* one of these three domains. Also, a given area can occupy all three domains at different times. A professor's office is front stage when a student visits, back stage when the student leaves, and outside when the professor is at a university basketball game.

Erving Goffman (1922–1982)

A Biographical Vignette

Erving Goffman died in 1982 at the peak of his fame. He had long been regarded as a cult figure in sociological theory. This status was achieved in spite of the fact that he had been professor in the prestigious sociology department at the University of California, Berkeley, and later held an endowed chair at the Ivy League's University of Pennsylvania.

By the 1980s he had emerged as a centrally important theorist. He had been elected president of the American Sociological Association in the year he died but was unable to give his presidential address because of advanced illness. Given Goffman's maverick status, Randall Collins says of his address: "Everyone wondered what he would do for his presidential address: a straight, traditional presentation seemed unthinkable for Goffman with his reputation as an iconoclast . . . we got a far more dramatic message: presidential address cancelled, Goffman dying. It was an appropriately Goffmanian way to go out."

Impression Management

In general, impression management is oriented to guarding against a series of unexpected actions, such as unintended gestures, inopportune intrusions, and *faux pas*, as well as intended actions, such as making a scene. Goffman was interested in the various methods of dealing with such problems.

1. One set of methods involves actions aimed at producing dramaturgical loyalty by, for example, fostering high in-group loyalty, preventing team members from identifying with those outside the performance, and changing audiences periodically so that they do not become too knowledgeable about the performers.
2. Goffman suggested various forms of dramaturgical discipline, such as having the presence of mind to avoid slips, maintain self-control, and manage the facial expressions and verbal tone of one's performance.
3. He identified various types of dramaturgical circumspection, such as determining in advance how a performance should go, planning for emergencies, selecting loyal teammates, selecting good audiences, being involved in small teams where dissension is less likely, making only brief appearances, preventing audience access to private information, and settling on a complete agenda to prevent unforeseen occurrences.

The audience also has a stake in successful impression management by the actor or actors. The audience often acts to save the show through such devices as giving great interest and attention to it, avoiding emotional outbursts, not noticing slips, and giving special consideration to neophyte performers.

One thing that many critics of Goffman's thinking on dramaturgy have pointed out is his cynical view of actors. He believed that actors are putting on performances and they are well aware of that fact. They cynically manipulate

Contemporary Applications

September 11, 2001, and the Stigmatization of Muslims

Prior to the 9/11 attacks on the World Trade Center and the Pentagon, relatively little hostility was aimed at Muslims in the United States. They were simply yet another group of immigrants who had integrated, or were integrating, into the United States. It was other groups—mainly Blacks and Mexican immigrants (especially those here illegally)—that were often stigmatized; Muslims largely escaped this process. However, the heinous acts of September 11—planned and committed largely, if not exclusively, by Muslims associated with Osama bin Laden and al-Qaeda—changed all that. There is an increasing and palpable tendency for many Americans to stigmatize Muslims both in and out of the United States. Some Muslims have a discredited stigma since their physical appearance, accent, mode of dress, and so on, make it clear to others (or seem to) that they are Muslims. Other Muslims whose appearance, accent, and way of dressing are not dissimilar from most other Americans are more likely to confront the stresses and strains of a discreditable stigma. Because of this, others who are mistakenly thought to be Muslim are also stigmatized.

One indicator of the increasing stigmatization of Muslims is the growing tendency for movies and television shows to depict the villains as Muslims. This was the case, for example, in the 2004–2005 season of the TV series *24* in which a group of ruthless Muslims (one of whom was willing to kill his own son and wife for the cause) were depicted as intent on death and destruction in the United States by, for example, causing a meltdown of nuclear reactors throughout the country. The stigmatization of Muslims was so blatant that the show had to issue disclaimers. At one point, the show's star, Kiefer Sutherland, appeared in a spot in which he claimed that the stigmatization of Muslims was *not* the intent of the show and that many Muslims were good Americans. In one episode, two clearly Muslim shop owners were depicted allying themselves with Jack Bauer (Sutherland's character on the show) and taking up arms against a private army employed by a ruthless defense contractor. Such disclaimers and actions did little to counter the stigmatization of Muslims on the show . . . and increasingly in the larger society.

their performances or the impressions they seek to make in order to accomplish their objectives. They are generally quite aware that some aspects of what they say and do are false, but they persevere nonetheless.

ETHNOMETHODOLOGY AND CONVERSATION ANALYSIS

Given its Greek roots, the term *ethnomethodology* literally means the methods that people use on a daily basis to accomplish their everyday lives. To put it slightly differently, the world is seen as an ongoing practical accomplishment. People are viewed as rational, but they use practical reasoning, not formal logic, in accomplishing their everyday lives.

Defining Ethnomethodology

The definition of **ethnomethodology** is the study of ordinary members of society in the everyday situations in which they find themselves and the ways in which they use commonsense knowledge, procedures, and considerations to gain an understanding of, navigate in, and act on those situations.

We can gain insight into the nature of ethnomethodology by examining efforts by its founder, Harold Garfinkel (1917–), to define it. Like Durkheim (see Chapter 2), Garfinkel considers social facts to be the fundamental sociological phenomenon. However, Garfinkel's social facts are very different from Durkheim's social facts. For Durkheim, social facts are external to and coercive of individuals. Those who adopt such a focus tend to see actors as constrained or determined by social structures and institutions and able to exercise little or no independent judgment. In the acerbic terms of the ethnomethodologists, such sociologists tended to treat actors like judgmental dopes.

In contrast, ethnomethodology treats the objectivity of social facts as the accomplishment of members (see below)—as a product of members' methodological activities. In other words, ethnomethodology is concerned with the organization of everyday, ordinary life. To the ethnomethodologist, the ways in which we go about organizing our ordinary, day-to-day lives are extraordinary.

Ethnomethodology is certainly not a macrosociology in the sense intended by Durkheim and his concept of a social fact, but its adherents do not see it as a microsociology either. Thus, while ethnomethodologists refuse to treat actors as judgmental dopes, they do not believe that people are continually thinking about themselves and what they ought to do in every situation that presents itself. Rather, they recognize that most often action is routine and relatively unreflective. Ethnomethodologists do not focus on actors or individuals, but rather on members. However, members are viewed not as individuals, but rather as membership activities, or the artful practices through which people produce what are *for them* both large-scale structures (e.g., bureaucracy, society) and the structures of everyday life (e.g., patterns of day-to-day interaction). In sum, ethnomethodologists are interested in *neither* microstructures *nor* macrostructures; they are concerned with the artful practices that produce people's sense of *both* types of structures. What Garfinkel and the ethnomethodologists have sought is a new way of getting at the traditional concern of sociology with objective structures, both small- and large-scale.

Accounts

One of Garfinkel's key points about ethnomethods is that they are reflexively accountable. **Accounts** are the ways in which actors explain (describe, criticize, and idealize) specific situations. **Accounting** is the process by which people offer accounts in order to make sense of the world. Ethnomethodologists devote a lot of attention to analyzing people's accounts, as well as to the ways in which accounts are offered and accepted (or rejected) by others. This is one of the reasons that ethnomethodologists are preoccupied with analyzing conversations. For example, when a student explains to her professor why she failed to take an examination, she is offering an account. The student is trying to make sense out of an event for her professor. Ethnomethodologists are interested in the nature of that account but more generally in the **accounting practices** by which the student offers the account and the professor accepts or rejects it. In analyzing accounts, ethnomethodologists adopt a stance of ethnomethodological indifference. They do not judge the nature of the accounts but rather analyze them in terms of how they are used in practical action. They are concerned with the accounts as well as the methods needed by both speaker and listener to proffer, understand, and accept or reject accounts.

Extending the idea of accounts, ethnomethodologists take great pains to point out that sociologists, like everyone else, offer accounts. Reports of sociological studies can be seen as accounts, and they can be analyzed by ethnomethodologists in the same way that all other accounts can be studied. This perspective on sociology serves to demystify the work of sociologists, indeed, all scientists. A good deal of sociology (indeed, all sciences) involves commonsense interpretations. Ethnomethodologists can study the accounts of the sociologist in the same way that they can study the accounts of the layperson. Thus, the everyday practices of sociologists and all scientists come under the scrutiny of the ethnomethodologist.

We can say that accounts are reflexive in the sense that they enter into the constitution of the state of affairs they make observable and are intended to deal with. When we offer an account of a situation that we are in, we are in the process altering the nature of that situation. If I am interacting with someone, realize that I have just made a faux pas, and seek to explain (account for) that mistake, in doing so I am changing the nature of that interaction. This is as true for sociologists as it is for laypeople. In studying and reporting on social life, sociologists are, in the process, changing what they are studying; subjects alter

Harold Garfinkel (1917–)

A Biographical Vignette

Harold Garfinkel was drafted in 1942 and entered the air force. Eventually he was given the task of training troops in tank warfare on a golf course on Miami beach in the complete absence of tanks. Garfinkel had only pictures of tanks from *Life Magazine*. The real tanks were all in combat. The man who would insist on concrete empirical detail in lieu of theorized accounts was teaching real troops who were about to enter live combat to fight against imagined tanks in situations where things like the proximity of the troops to the imagined tank could make the difference between life and death. The impact of this on the development of his views can only be imagined. He had to train troops to throw explosives into the tracks of imaginary tanks; and to keep imaginary tanks from seeing them by directing fire at imaginary tank ports. This task posed, in a new and very concrete way, the problems of the adequate description of action and accountability that Garfinkel would take up as theoretical issues.

their behavior as a result of being the subject of scrutiny and in response to descriptions of that behavior.

Some Examples

Ethnomethodology has gained much notoriety through its research.

Breaching Experiments In **breaching experiments**, social reality is violated in order to shed light on the methods by which people construct social reality. The assumption behind this research is not only that the methodical production of social life occurs all the time but also that the participants are unaware that they are engaging in such actions. The objective of the breaching experiment is to disrupt normal procedures so that the process by which the everyday world is constructed or reconstructed can be observed and studied.

Lynch offers the following example (Figure 6.1) of breaching, derived from earlier work by Garfinkel. This, of course, is a game of tic-tac-toe. The rules allow participants in the game to place a mark *within* each of the cells, but the rules have been breached in this case and a mark has been placed by player 1 *between* two cells. If this breach were to occur in a real game of tic-tac-toe, the other player (player 2) would likely insist on its being erased and placed correctly. If such a new placement did not occur, player 2 would try to explain (offer an account of) why player 1 had taken such an extraordinary action. The actions of player 2 would be studied by the ethnomethodologist to see how the everyday world of tic-tac-toe is reconstructed.

In another experiment, Garfinkel asked his students to spend between 15 minutes and an hour in their own homes imagining that they were boarders and then acting on the basis of that assumption. They were told to behave in ways that are usually not found in a family situation. For example, they were instructed to be polite, cautious, impersonal, and formal; they were to speak only when family members spoke to them. In the vast majority of cases, family members were dumbfounded and outraged by such behavior. The students reported (offered accounts of) family members who expressed astonishment, bewilderment, shock, anxiety, embarrassment, and anger. Family members charged that the students who engaged in these behaviors were mean, inconsiderate, selfish, nasty, or impolite. These reactions indicate how important it is that people act in accord with the commonsense assumptions about how they are supposed to behave.

What most interested Garfinkel was how the family members sought in commonsense ways to cope with such a breach. They demanded explanations from the students for their behavior. In the questions they asked of students, they often implied an explanation of the aberrant behavior. They asked whether the students were ill, had been fired, were out of their minds, or were just stupid.

Family members also sought to explain the behaviors to themselves in terms of previously understood motives. For example, a student was thought to be behaving oddly because she was working too hard or had had a fight with her fiancé. Such explanations are important to participants—the other family members, in this case—because the explanations help them feel that under normal circumstances interaction would occur as it always had.

If the student did not acknowledge the validity of such explanations, family members were likely to withdraw and to seek to isolate, denounce, or retaliate against the culprit. Deep emotions were aroused because the effort to restore order through explanation was rejected by the student. The other family members felt that more intense statements and actions were necessary to restore the equilibrium. In one case, the student was told that if he did not stop behaving in

this way, he had better move out. In the end, the students explained the experiment to their families, and in most situations harmony was restored. However, in some instances hard feelings lingered.

Breaching experiments are undertaken to illustrate the way people order their everyday lives. These experiments reveal the resilience of social reality, since the subjects (or victims) move quickly to normalize the breach—that is, to render the situation accountable in familiar terms. It is assumed that the way people handle these breaches tells us much about how they handle their everyday lives. Although these experiments seem innocent enough, they often lead to highly emotional reactions. These extreme reactions reflect how important it is to people to engage in routine, commonsense activities. Reactions to breaches are sometimes so extreme that ethnomethodologists have been warned in more recent years not to perform the kinds of breaching experiments performed by Garfinkel.

Accomplishing Gender

It seems incontrovertible that one's gender—male or female—is biologically based. People are seen as simply manifesting the behaviors that are an outgrowth of their biological makeup. People are not usually thought of as accomplishing their gender. In contrast, sexiness is clearly an accomplishment; people need to speak and act in certain ways in order to be seen as sexy. However, it is generally assumed that one does not have to do or say *anything* to be seen as a man or a woman. Ethnomethodology has investigated the issue of gender, with some very unusual results.

The ethnomethodological view is traceable to one of Harold Garfinkel's now classic demonstrations of the utility of this orientation. In the 1950s Garfinkel met a person named Agnes, who seemed unquestionably a woman. Not only did she have the figure of a woman, but it was virtually a perfect figure with an ideal set of measurements. She also had a pretty face, good complexion, no facial hair, and plucked eyebrows—and she wore lipstick. This was clearly a woman, or was it? Garfinkel discovered that Agnes had not always appeared to be a woman. In fact, at the time he met her, Agnes was trying, eventually successfully, to convince physicians that she needed an operation to remove her male genitalia and create a vagina.

Agnes was defined as a male at birth. In fact, she was by all accounts a boy until she was 16 years of age. At that age, sensing something was awry, Agnes ran away from home and started to dress like a girl. She soon discovered that dressing like a woman was not enough; she had to *learn to act* like (to pass as) a woman if she was to be accepted as one. She did learn the accepted practices and as a result came to be defined, and to define herself, as a woman. Garfinkel was interested in the passing practices that allowed Agnes to function like a woman in society. The more general point here is that we are not simply born men or women; we all also learn and routinely use the commonplace practices that allow us to pass as men or women. Only in learning these practices do we come to be, in a sociological sense, a man or a woman. Thus, even a category

like gender, which is thought to be an ascribed status, can be understood as an accomplishment of a set of situated practices.

EXCHANGE THEORY

Another theory of everyday behavior is exchange theory. Although there are a number of varieties of exchange theory in sociology, the focus here is on the work of George Homans.

The Exchange Theory of George Homans

Although there are a variety of inputs into George Homans's development of exchange theory, perhaps the most important is the psychological theory known as behaviorism. The behavioral sociologist is concerned with the relationship between the effects of an actor's behavior on the environment and the impact on the actor's later behavior. This relationship is basic to **operant conditioning**, or the learning process by which the consequences of behavior serve to modify that behavior. One might almost think of this behavior, at least initially in the infant, as a random behavior. The environment in which the behavior exists, whether social or physical, is affected by the behavior and in turn acts back in various ways. That reaction—positive, negative, or neutral—affects the actor's later behavior. If the reaction has been rewarding to the actor, the same behavior is likely to be emitted in the future in similar situations. If the reaction has been painful or punishing, the behavior is less likely to occur in the future. The behavioral sociologist is interested in the relationship between the history of environmental reactions or consequences and the nature of present behavior. Past consequences of a given behavior govern its present state. By knowing what elicited a certain behavior in the past, we can predict whether an actor will produce the same behavior in the present situation.

The heart of George Homans's exchange theory lies in a set of fundamental propositions powerfully influenced by behaviorism. Although some of Homans's propositions deal with at least two interacting individuals, he was careful to point out that these propositions are based on psychological principles. According to Homans, they are psychological for two reasons: (1) They are usually the province of psychologists and (2) they deal with individual behavior rather than large-scale structures like groups or societies. As a result of this position, Homans admitted to being a psychological reductionist. To Homans, reductionism involves showing that the propositions of one science (in this case sociology) are derived from the more general propositions of another science (in this case, psychology).

operant conditioning The learning process by which the consequences of behavior serve to modify that behavior.

Although Homans made the case for psychological principles, he did not think of individuals as isolated. He recognized that people are social and spend a considerable portion of their time interacting with other people. He attempted to explain social behavior with psychological principles. In other words, the principles that apply to the relationship between human beings and the physical environment are the same as those that relate to instances where the environment is made up of other human beings. Homans did not deny the Durkheimian position of emergence—that something new emerges from interaction. Instead, he argued that those emergent properties can be explained by psychological principles; there is no need for new sociological propositions to explain social facts. He used the basic sociological concept of a norm as illustration. Homans does not doubt that norms exist and that they lead to conformity. However, people do not conform automatically. They do so because they see it as an advantage to conform to those norms.

Homans detailed a program to bring men back into sociology, but he also tried to develop a theory that focuses on psychology, people, and the elementary forms of social life. In terms of the latter, he focused on social behavior involving at least two people in the exchange of tangible and intangible activities. Such behavior would vary in terms of the degree to which it was rewarding or costly to the people involved.

For example, Homans sought to explain the development of power-driven machinery in the textile industry, and thereby the Industrial Revolution, through the psychological principle that people are likely to act in such a way as to increase their rewards. More generally, in his version of exchange theory, he sought to explain elementary social behavior in terms of rewards and costs. Homans set for himself the task of developing propositions that focus on the psychological level; these form the groundwork of exchange theory.

Roots in Behaviorism In *Social Behavior: Its Elementary Forms*, Homans acknowledged that his exchange theory was derived, in large part, from behavioral psychology. In fact, Homans regretted that his theory was labeled exchange theory because he viewed it as behavioral psychology applied to specific situations. Homans began with a discussion of the work of the leading figure in psychological behaviorism, B. F. Skinner—in particular, Skinner's study of pigeons born with the ability to explore their environments by pecking at the things that confronted them. Placed in an experimental cage, pigeons begin to peck and eventually peck at a target placed there by the researcher. When the pigeon does so, it is rewarded with a bit of grain. Since the pigeon has been rewarded for pecking the target, the chances are good that it will do so again. In formal, behaviorist terms, the pecking at the target is the operant, that operant has been reinforced, and the reinforcer was the bit of grain. Thus, the pigeon has undergone a process of operant conditioning: The pigeon has learned to peck the target because it has been rewarded for doing so.

Skinner was interested in this instance in pigeons; Homans's concern was humans. According to Homans, Skinner's pigeons are not engaged in a true exchange relationship with the psychologist. The pigeon is engaged in a

George Caspar Homans (1910–1989)

An Autobiographical Vignette

I had long known Professor Talcott Parsons and was now closely associated with him in the Department of Social Relations. The sociological profession looked upon him as its leading theorist. I decided that what he called theories were only conceptual schemes, and that a theory was not a theory unless it contained at least a few propositions. I became confident that this view was correct by reading several books on the philosophy of science.

Nor was it enough that a theory should contain propositions. A theory of a phenomenon was an explanation of it. Explanation consisted in showing that one or more propositions of a low order of generality followed in logic from more general propositions applied to what were variously called given or boundary conditions or parameters. I stated my position on this issue in my little book *The Nature of Social Science* (1967).

I then asked myself what general propositions I could use in this way to explain the empirical propositions I had stated in *The Human Group* and other propositions brought to my attention by later reading of field and experimental studies in social psychology. The general propositions would have to meet only one condition: In accordance with my original insight, they should apply to individual human beings as members of a species.

Such propositions were already at hand—luckily, for I could not have invented them for myself. They were the propositions of behavioral psychology as stated by my old friend B. F. Skinner and others. They held good of persons both when acting alone in the physical environment and when in interaction with other persons. In the two editions of my book *Social Behavior* (1961 and revised in 1974), I used these propositions to try to explain how, under appropriate given conditions, relatively enduring social structures could arise from, and be maintained by, the actions of individuals, who need not have intended to create the structures. This I conceive to be the central intellectual problem of sociology.

one-sided exchange relationship, whereas human exchanges are at least two-sided. The pigeon is being reinforced by the grain, but the psychologist is not truly being reinforced by the pecks of the pigeon. The pigeon is carrying on the same sort of relationship with the psychologist as it would with the physical environment. Because there is no reciprocity, Homans defined this as individual behavior. He seemed to relegate the study of this sort of behavior to the psychologist, whereas he urged the sociologist to study social behavior in which the activities of two (or more) human beings reinforce (or punish) the activities of the other. In other words, Homans is interested in behavior in which each person influences the other. However, it is significant that, according to Homans, *no new propositions* are needed to explain social behavior as opposed to individual behavior. The laws of individual behavior as developed by Skinner in his study of pigeons explain social behavior as long as we take into account the complications of mutual reinforcement.

Homans admitted that he might ultimately have to go beyond the principles derived by Skinner, but only reluctantly.

In his theoretical work, Homans restricted himself to everyday social interaction. It is clear, however, that he believed that a sociology built on his principles would ultimately be able to explain all social behavior. Homans used the case of two office workers to exemplify the kind of exchange relationships he was interested in. According to office rules, each person was to do his job on his own. If help was needed, a supervisor was to be consulted. However, suppose one of the workers (worker A) had trouble completing his work from time to time, but he could do it better and more quickly with help. According to the rules, he should consult his supervisor, but to do so would make his incompetence clear to the supervisor and adversely affect his future with the organization. It is far safer to ask his colleague (worker B) for help, especially if she has more experience and greater capacity to do the work. It is also assumed that such a consultation will not come to the supervisor's attention. One worker gives the needed assistance and the other offers thanks and approval. In other words, an exchange has occurred between them—help in exchange for approval.

Basic Propositions

Focusing on this sort of situation, and basing his ideas on Skinner's findings, Homans developed several propositions.

1. The *success proposition* states that the more often a person is rewarded for a particular action, the more likely the person is to perform the rewarded action. In terms of the office situation example, this proposition means that worker A is more likely to ask others for advice if he has been rewarded in the past with useful advice. Furthermore, the more often a person received useful advice in the past, the more often he or she will request advice in the future. Similarly, the other person (worker B) will be more willing to give advice and give it more frequently if he or she often has been rewarded with approval in the past. Generally, behavior in accord with the success proposition involves three stages: first, a person's action; next, a rewarded result; and finally, a repetition of the original action or at minimum one similar in at least some respects.

Homans specified a number of things about the success proposition. First, although it is generally true that increasingly frequent rewards lead to increasingly frequent actions, this reciprocation cannot go on indefinitely. At some point individuals simply cannot act that way as frequently. Second, the shorter the interval between behavior and reward, the more likely a person is to repeat the behavior. Conversely, long intervals between behavior and reward lower the likelihood of repeat behavior. Finally, it was Homans's view that intermittent rewards are more likely to elicit repeat behavior than regular rewards. Regular rewards lead to boredom and satiation, whereas rewards at irregular intervals (as in gambling) are very likely to elicit repeat behaviors.

2. The *stimulus proposition* asserts that if in the past a person's action has been rewarded as a result of responding to a particular stimulus, or set of stimuli, then the person is more likely to perform the same action (or something similar) when stimuli are applied that are similar to those in the past. In the office worker example, if, in the past, the two workers in question found the giving and getting of advice rewarding, then they are likely to engage in similar actions in similar situations in the future. Homans offered an even more down-to-earth example when he argued that those who catch fish in dark pools are more likely to fish in such pools in the future.

Homans was interested in the process of **generalization**, the tendency to extend behavior to similar circumstances. In the fishing example, one aspect of generalization is to move from fishing in dark pools to fishing in any pool with any degree of shadiness. Similarly, success in catching fish is likely to lead from one kind of fishing to another (e.g., freshwater to saltwater) or even from fishing to hunting. However, the process of **discrimination** is also important. The actor may fish only under the specific circumstances that proved successful in the past. For one thing, if the conditions under which success occurred were too complicated, then similar conditions may not stimulate behavior. If the crucial stimulus occurs too long before behavior is required, then it may not actually stimulate that behavior. An actor can become oversensitized to stimuli, especially if they are very valuable to the actor. In fact, the actor could respond to irrelevant stimuli, at least until the situation is corrected by repeated failures. All this is affected by the individual's alertness or attentiveness to stimuli.

3. The *value proposition* states that the more valuable people find the results of their action, the more likely they are to perform that action. In the office worker example, if the rewards each worker offers to the other are considered valuable, the workers are more likely to perform the desired behaviors than if the rewards are not seen as valuable. At this point, Homans introduced the concepts of rewards and punishments. **Rewards** are actions with positive values; an increase in rewards is more likely to elicit the desired behavior. **Punishments** are actions with negative values; an increase in punishment means that the actor is less likely to manifest undesired behaviors. Homans found punishments to be an inefficient means of getting people to change their behavior, because people may react in undesirable ways to the punishment. It is preferable simply not to reward undesirable behavior (e.g., anger); then such behavior eventually becomes

generalization The tendency to extend behavior to similar circumstances.

discrimination The tendency to manifest behavior only under the specific circumstances that proved successful in the past.

rewards Actions with positive values; an increase in such actions is more likely to elicit the desired behavior.

punishments Actions with negative values; an increase in such actions means that the actor is less likely to manifest undesired behaviors.

extinguished. Rewards are clearly to be preferred, but they may be in short supply. Homans did make it clear that his is not simply a hedonistic theory; rewards can be either materialistic (e.g., money) or altruistic (helping others).

4. The *deprivation-satiation proposition* contends that the more often in the recent past people have received a particular reward, the less valuable will be future rewards of that type. In the office example, the two workers may reward each other so often for giving and getting advice that the rewards cease to be valuable to each other. Time is crucial here; people are less likely to become satiated if particular rewards are stretched over a long period of time.

At this point, Homans defined two other critical concepts: cost and profit. The **cost** of any behavior is defined as the rewards lost in forgoing alternative lines of action. **Profit** in social exchange is seen as the greater number of rewards gained over costs incurred. The latter led Homans to recast the deprivation-satiation proposition as the greater the profits people receive as a result of particular actions, the more likely they are to perform those actions.

5. There are two *aggression-approval propositions*. In Proposition 5A Homans argues that when people do not receive expected rewards for their actions, or they receive unanticipated punishment, they become angry, more likely to act aggressively, and to find the results of such aggressive behavior more valuable.

In the office worker example, if worker A does not get the advice he or she expects and worker B does not receive the praise he or she anticipates, both are likely to be angry. We are surprised to find the concepts of frustration and anger in Homans's work, because they would seem to refer to mental states. Purists in behaviorism would not deal with such states of mind. Homans went on to argue that frustration of such expectations need *not* refer only to an internal state. It can also refer to wholly external events, observable not just by worker A but also by outsiders.

Proposition 5A on aggression-approval refers only to negative emotions, whereas Proposition 5B deals with more positive emotions and argues that people will be pleased when they receive an expected reward, especially one that is greater than expected; they will, as a result, be more likely to perform the behavior that has received approval and the results of that behavior will become of increasing value. For example, in the office worker example, when worker A gets the advice that he or she expects and worker B gets the praise that he or she expects, both are pleased and more likely to get or give advice. Advice and praise become more valuable to each.

6. In the *rationality proposition* people are seen as choosing from the available alternatives, the action for which, given the person's perception at the time, there are greater rewards and greater probability of getting those rewards.

cost Rewards lost in adopting a specific action and, as a result, in forgoing alternative lines of action.

profit The greater number of rewards gained over costs incurred in social exchange.

Although the earlier propositions rely heavily on behaviorism, the rationality proposition demonstrates most clearly the influence of rational choice theory (see the next section) on Homans's approach. In economic terms, actors who act in accord with the rationality proposition are maximizing their **utilities**.

Basically, people examine and make calculations about the various alternative actions open to them. They compare the amount of rewards associated with each course of action. They also calculate the likelihood that they will actually receive the rewards. Highly valued rewards are devalued if the actors think it unlikely that they will obtain them. On the other hand, lesser-valued rewards will be enhanced if they are seen as highly attainable. Thus, there is an interaction between the value of the reward and the likelihood of attainment. The most desirable rewards are those that are *both* very valuable *and* highly attainable. The least desirable rewards are those that are not very valuable and difficult to attain.

Homans related the rationality proposition to the success, stimulus, and value propositions. The rationality proposition tells us that whether or not people perform an action depends on their perceptions of the probability of success. But what determines this perception? Homans argued that perceptions of whether chances of success are high or low are shaped by past successes and the similarity of the present situation to past successful situations. The rationality proposition also does not tell us why an actor values one reward more than another; for this we need the value proposition. In these ways, Homans linked his rationality principle to his more behavioristic propositions.

In the end, Homans's theory can be condensed to a view of the actor as a rational profit seeker. However, Homans's theory was weak on mental states and large-scale structures. For example, on the subject of consciousness Homans admitted the need for a more fully developed psychology.

Despite such weaknesses, Homans remained a behaviorist who worked resolutely at the level of individual behavior. He argued that large-scale structures can be understood if we adequately understand elementary social behavior. He contended that exchange processes are identical at the individual and societal levels, although he granted that at the societal level there is greater complexity to the ways in which fundamental processes are put together to form large-scale phenomena.

RATIONAL CHOICE THEORY

Although it influenced the development of exchange theory, rational choice theory was generally marginal to mainstream sociological theory. Largely through the efforts of one man, James S. Coleman, rational choice theory has

utilities Actor's preferences, or values.

become one of the "hot" theories in contemporary sociology. For one thing, in 1989 Coleman founded a journal, *Rationality and Society*, devoted to the dissemination of work from a rational choice perspective. For another, Coleman published an enormously influential book, *Foundations of Social Theory*, based on this perspective. Finally, Coleman became president of the American Sociological Association in 1992 and used that forum to push rational choice theory and to present an address entitled "The Rational Reconstruction of Society."

A Skeletal Model

The basic principles of rational choice theory are derived from neoclassical economics (as well as utilitarianism and game theory). Based on a variety of different models, it is possible to piece together what can be described as a skeletal model of rational choice theory.

The focus in rational choice theory is on actors. Actors are seen as being purposive, or as having intentionality; that is, actors have ends or goals toward which their actions are aimed. Actors are also seen as having preferences (or values, utilities). Rational choice theory is unconcerned with what these preferences, or their sources, are. Of importance is the fact that action is undertaken to achieve objectives consistent with an actor's preference hierarchy.

Although rational choice theory starts with actors' purposes or intentions, it must take into consideration at least two major constraints on action. The first is the scarcity of resources. Actors have different resources as well as differential access to other resources. For those with lots of resources, the achievement of ends may be relatively easy. However, for those with few, if any, resources, the attainment of ends may be difficult or impossible.

Related to scarcity of resources is the idea of **opportunity costs**. In pursuing a given end, actors must keep an eye on the costs of forgoing their next most attractive action. An actor may choose not to pursue the most highly valued end if her resources are negligible, if, as a result, the chances of achieving that end are slim, and if in striving to achieve that end she jeopardizes her chances of achieving her next most valued end. Actors are seen as trying to maximize their benefits; that goal may involve assessing the relationship between the chances of achieving a primary end and what that achievement does for chances for attaining the second most valuable objective.

A second source of constraints on individual action is social institutions. Such constraint occurs throughout the life course and is manifest through schools and their rules, the policies of employing organizations, and the laws of society. These all serve to restrict choices available to actors and, thereby, the outcome of actions. These institutional constraints provide both positive and negative sanctions that serve to encourage certain actions and to discourage others.

opportunity costs The costs of forgoing the next most attractive action when an actor chooses an action aimed at achieving a given end.

It is possible to enumerate two other ideas that can be seen as basic to rational choice theory. The first is an aggregation mechanism whereby a variety of individual actions are combined to form a social outcome. The second is the importance of information in making rational choices. At one time, it was assumed that actors had perfect, or at least sufficient, information to make purposive choices among the alternative courses of action open to them. However, there is a growing recognition that the quantity or quality of available information is highly variable and that variability has a profound effect on actors' choices.

In his introductory comments to the first issue of *Rationality and Society*, Coleman made it clear that he gave allegiance to rational choice theory not only because of the strengths of the theory itself, but also because it is the only theory capable of producing a more integrative sociological approach. He views rational choice theory as providing the micro-level base for the explanation of macro-level phenomena. Beyond such academic concerns, Coleman wants work done from a rational choice perspective to have practical relevance to our changing social world. For example, the issue of public policies aimed at AIDS prevention has been studied from a rational choice perspective.

Foundations of Social Theory

Coleman argues that sociology should focus on social systems, but that such macro-phenomena must be explained by factors internal to them, ideally, individuals. He favors working at the individual level for several reasons, including the fact that data are usually gathered at that level and then aggregated or composed to yield the system level. Among the other reasons for favoring a focus on the individual level is that this is where interventions are ordinarily made to create social changes. Central to Coleman's perspective is the idea that social theory is not merely an academic exercise but should affect the social world through such interventions.

Given his focus on the individual, Coleman recognizes that he is a methodological individualist, although he views his particular perspective as a special variant of that orientation. His view is special in the sense that it accepts the idea of emergence and that while it focuses on factors internal to the system, those factors are not necessarily individual actions and orientations. Micro-level phenomena other than individuals can be the focus of his analysis.

Coleman's rational choice orientation is clear in his basic idea that people act toward goals in a purposive manner and both goals and actions are shaped by values (or preferences). But Coleman then goes on to argue that for most theoretical purposes, he will need a more precise conceptualization of the rational actor derived from economics, one that sees the actors choosing those actions that will maximize utility, or the satisfaction of their needs and wants.

The two key elements in his theory are actors and resources. Resources are those things over which actors have control and in which they have some interest. Given these two elements, Coleman details how their interaction leads to the system level. This is based on the fact that actors have resources and those resources are of interest to others. As a result, actors engage in actions

James S. Coleman (1926–1995)

A Biographical Vignette

Looking back from the vantage point of the mid-1990s, Coleman found that his macro-level approach had changed. For example, with respect to his work on social simulation games at Johns Hopkins in the 1960s, he said that they “led me to change my theoretical orientation from one in which properties of the system are not only determinants of action (à la Emile Durkheim’s *Suicide* study), to one in which they are also consequences of actions sometimes intended, sometimes unintended.” Coleman needed a theory of action, and he chose, in common with most economists,

the simplest such foundation, that of rational, or if you prefer, purposive action. The most formidable task of sociology is the development of a theory that will move from the micro-level of action to the macro-level of norms, social values, status distribution, and social conflict.

This interest explains why Coleman is drawn to economics:

What distinguishes economics from the other social sciences is not its use of rational choice but its use of a mode of analysis that allows moving between the level of individual action and the level of system functioning. By making two assumptions, that persons act rationally and that markets are perfect with full communication, economic analysis is able to link the macro-level of system functioning with the micro-level of individual actions.

Another aspect of Coleman’s vision for sociology, consistent with his early work on schools, is that it be applicable to social policy. Of theory he says, “One of the criteria for judging work in social theory is its potential usefulness for informing social policy.”

that involve others and a system of action, a structure, emerges among them. In other words, interdependent actors, each seeking to maximize interests, form a social system.

Given his orientation to individual rational action, it follows that Coleman’s focus in terms of the micro-macro issue (see, especially, Chapter 7) is the micro-to-macro linkage, or how the combination of individual actions creates the larger system. While he accords priority to this issue, Coleman is also interested in the macro-to-micro linkage, or how the macro-system constrains the orientations of actors. Finally, he is interested in the micro-micro aspect of the relationship, or the impact of individual behavior on the behavior of other individuals.

In spite of this seeming balance, there are at least three major weaknesses in Coleman’s approach. First, he accords overwhelming priority to the micro-to-macro issue, thereby giving short shrift to the other relationships (macro-micro, micro-micro). Second, he ignores the macro-macro issue. Finally, his causal arrows go mainly in one direction (macro to micro); in other words, he ignores the ongoing reciprocal relationship among and between micro and macro phenomena.

Utilizing his rational choice approach and starting at the micro-level of rational individual behavior, Coleman seeks to explain a series of macro-level phenomena including collective behavior, norms, and the corporate actor.

Collective Behavior. Coleman (and other rational choice theorists) chooses to deal with collective behavior (of, for example, a crowd) because its often disorderly and unstable character is thought to be difficult to analyze from a rational choice perspective. But Coleman’s view is that rational choice theory *can* explain all types of macro phenomena, not just those that are orderly and stable. What is involved in collective behavior is the unilateral transfer by rational actors of control over their actions to others (e.g., crowd organizers or leaders). They do this in an attempt to maximize their utility. Normally, such maximization involves a balancing of control among several actors; this balance produces equilibrium within society. However, in the case of collective behavior, because there is a unilateral transfer of control, individual maximization creates an imbalance and does not necessarily lead to system equilibrium. Instead, there is the disequilibrium characteristic of collective behavior such as in the case of an unruly crowd.

Norms. Another macro-level phenomenon that comes under Coleman’s scrutiny is norms. Unlike collective behavior, norms are not only quite stable but they serve to produce order in society. While most sociologists take norms as given and invoke them to explain individual behavior, they do not explain why and how norms come into existence. Coleman wonders how, in a group of rational actors, norms emerge and are maintained. He argues that norms are created and maintained by some people who see benefits resulting from norms that control group behavior and see harm stemming from the violation of those norms. Thus, norms against smoking in public places have emerged because they protect nonsmokers (likely those who helped create the norms) from second-hand smoke and violation of such norms would lead to higher rates of lung cancer among them. People are willing to give up some control over their own behavior (others decide whether smoking in public places is permissible), but in the process they gain some individual and collective control (through norms) over the behavior of others (preventing them from smoking in such settings). Once again, people are seen as maximizing their utility by partially surrendering rights of control over themselves and gaining some control over others. Because the transfer of control is mutual, it is *not* unilateral as it is in the case of collective behavior, there is equilibrium in the case of norms.

Norms often act to the advantage of some people (e.g., nonsmokers) and to the disadvantage of others (smokers). In some cases (including smoking in public places), actors surrender the right to control their own actions to those who initiate and maintain the norms. Such norms become effective when a consensus emerges that some people have the right to control (through norms) the actions of other people. Furthermore, the effectiveness of norms depends on the ability to enforce that consensus (e.g., forcing violators to extinguish their cigarettes in public places). This consensus and enforcement are other factors that prevent the kind of disequilibrium characteristic of collective behavior.

Coleman recognizes that norms become interrelated (bans on smoking on airplanes and in airports), but he sees such a macro-macro (norm-norm) issue as beyond the scope of his work on the foundations of social systems. However, he is willing to take on the macro-to-micro issue of the internalization of norms. He sees the internalization of norms as the establishment of an internal sanctioning system; people sanction themselves when they violate a norm. Coleman looks at this in terms of the idea of one actor or set of actors endeavoring to control others by having norms internalized in them. Thus, it is in the interests of one set of actors to have another set of people internalize norms and be controlled by them.

The Corporate Actor. Within such a collectivity as a corporation or a state, individual actors may not make choices among actions in terms of their self-interest but often must choose on the basis of the interest of the collectivity. Thus, a U.S. President might choose not to run for a second term even though it would be in his self-interest to do so. Rather, he chooses that option because it is in the interest of his political party, the nation, and its citizens.

There are various rules and mechanisms for moving from individual choice to collective (social) choice. The simplest is the case of voting and the procedures for tabulating the individual votes and coming up with a collective decision. This is the micro-to-macro dimension, while such things as the slate of candidates proposed by the collectivity involve the macro-to-micro linkage.

Coleman argues that both corporate actors and human actors have purposes. Furthermore, within a corporate structure such as an organization, human actors may pursue purposes of their own that are at variance with corporate purposes. This conflict of interest helps us understand the sources of revolts against corporate authority. The micro-to-macro linkage here involves the ways in which people divest authority from the corporate structure and vest legitimacy in those engaged in the revolt. But there is also a macro-to-micro linkage in that certain macro-level conditions lead people to such acts of divestment and investment.

As a rational choice theorist, Coleman starts with the individual and with the idea that is where all rights and resources exist. It is the interests of individuals that should determine the course of events. However, this is often not the case, especially in modern society, where many rights, significant resources, and even sovereignty reside in corporate actors. In the modern world corporate actors have taken on increasing importance. The corporate actor may act to the benefit or the harm of the individual. How are we to judge the corporate actor in this regard? Coleman contends that we need to do this on the basis of the assumption that it is individual persons who are sovereign and the social system must be evaluated on the basis of how well it serves individual sovereignty.

Coleman differentiates between traditional structures based on the family, such as neighborhoods and religious groups, and purposive structures, such as economic organizations and the government. There have always been corporate actors, but the traditional ones, such as the family, are steadily being

replaced by new, purposively constructed, free-standing corporate actors. He sees a progressive "unbundling" of the activities that once were tied together within, for example, the family. Such traditional structures are "unraveling" as their functions are dispersed and taken over by a range of corporate actors (e.g., child care centers in the case of the family). Coleman is concerned about this unraveling as well as about the fact that we are now forced to deal with positions in purposive structures (e.g., managers) rather than with the people who populated traditional structures. The existence of these new corporate actors raises the issue of how to ensure that they are socially responsible. Coleman suggests that we can do this by instituting internal reforms or by changing the external structure, such as the laws affecting such corporate actors or the agencies that regulate them.

The ultimate goal of Coleman's work is the creation of a new social structure as the traditional one upon which people depended disappears. The passing of traditional structures and their replacement by purposive structures have left a series of voids that have not been filled adequately by the new social organizations. Social theory and the social sciences more generally are made necessary by the need to reconstruct a new society. The goal is not to destroy purposive structures but rather to realize the possibilities, and to avoid the problems, of such structures.

An overview of the field confirms Coleman's views on rational choice theory. Work continues on many of the macro-issues identified by Coleman (e.g., collective behavior), but it has also expanded not only into other macro-areas (e.g., social stratification), but also to micro-areas (e.g., emotions) that one would not immediately think of as being amenable to rational choice analysis.

Although he has faith in rational choice theory, Coleman does not believe that this perspective, at least as yet, has all the answers. But it is clear that he believes that it can move in that direction. His hope is that work in rational choice theory will, over time, reduce the issues that cannot be dealt with by that theory.

Coleman recognizes that in the real world people do not always behave rationally, but he believes that this makes little difference in his theory; the same theoretical predictions would be made whether or not people behave rationally.

Summary

1. Symbolic interactionism, like the other theories discussed in this chapter, focuses on everyday life, especially interaction (as well as action and people as agents) and the symbols (and their meanings) that are deeply implicated in it.
2. Symbolic interactionism is defined by a set of fundamental assumptions:
 - a. People act toward things on the basis of the meanings those things have for them and these meanings stem from their interactions with other people.
 - b. People do not simply internalize the meanings that they learn through social interaction, but they are also able to modify them through an interpretive process.

- c. People, in contrast to other animals, are unique in their ability to use and rely on symbols.
 - d. People become human through social interaction, especially in the early years with family members and then in school.
 - e. People are conscious, capable of reflecting on themselves and what they do, and therefore capable of shaping their actions and interactions.
 - f. People have purposes when they act in, as well as toward, situations.
 - g. Society consists of people engaging in social interaction.
3. To Erving Goffman, dramaturgy views social life as a series of dramatic performances akin to those performed in the theater.
 4. From a dramaturgical perspective, the self is a sense of who one is that is a dramatic effect that emerges from the immediate scene being presented.
 5. Impression management involves techniques actors use to maintain certain impressions in the face of problems they are likely to encounter, and methods they use to cope with these problems.
 6. The front stage is that part of dramaturgical performance that generally functions in rather fixed and general ways to define the situation for those who observe the performance.
 7. The back stage is where facts suppressed in the front stage or various kinds of informal actions may appear.
 8. Role distance deals with the degree to which individuals separate themselves from the roles they are in.
 9. Stigma involves a gap between virtual (what a person ought to be) and actual (what a person actually is) social identity.
 10. A discredited stigma occurs when the actor assumes that the differences are known by the audience members, or are evident to them, while a discreditable stigma is one in which the differences are neither known by audience members nor perceivable by them.
 11. Ethnomethodology is the study of ordinary members of society in the everyday situations in which they find themselves and the ways in which they use common-sense knowledge, procedures, and considerations to gain an understanding of, navigate in, and act on those situations.
 12. Ethnomethodologists are concerned with accounts, accounting, and accounting practices.
 13. Breaching experiments violate social reality in order to shed light on the methods by which people construct social reality.
 14. George Homans's exchange theory is based primarily on behaviorist principles.
 15. The heart of Homans's exchange theory lies in the following propositions:
 - a. The more often a person is rewarded for a particular action, the more likely the person is to perform the rewarded action.
 - b. If in the past a person's action has been rewarded as a result of responding to a particular stimulus, or set of stimuli, then the person is more likely to perform the same action (or something similar) when stimuli are applied that are similar to those in the past.
 - c. The more valuable people find the results of their action, the more likely they are to perform that action.
 - d. The more often in the recent past people have received a particular reward, the less valuable will be future rewards of that type.

- e. When people do not receive expected rewards for their actions, or they receive unanticipated punishment, they become angry and are more likely to act aggressively and to find the results of such aggressive behavior more valuable.
 - f. People are pleased when they receive an expected reward, especially one that is greater than expected; and they will, as a result, be more likely to perform the behavior that has received approval and the results of that behavior will become of increasing value.
 - g. People choose from the available alternatives the action for which, given the person's perception at the time, there are greater rewards and greater probability of getting those rewards.
16. The focus in rational choice theory is on actors.
 17. Actors are seen as being purposive, or as having intentionality; that is, actors have ends or goals toward which their actions are aimed.
 18. Actors are also seen as having preferences (or values, utilities). Rational choice theory is unconcerned with what these preferences, or their sources, are. Of importance is the fact that action is undertaken to achieve objectives consistent with an actor's preference hierarchy.
 19. In addition, rational choice theory must take into account scarcity of resources and opportunity costs, or the costs of forgoing their next most attractive action, as well as the constraints imposed by social institutions.
 20. Utilizing a rational choice approach and starting at the micro-level of rational individual behavior, Coleman seeks to explain a series of macro-level phenomena, including collective behavior, norms, and the corporate actor.

In previous chapters we have dealt with a variety of contemporary theories that focus either on the large-scale structures and institutions of society (Chapters 4 and 5) or on the micro-levels we associate with everyday life (Chapter 6). In this chapter we deal with theoretical efforts that have sought to deal with the full range of micro-macro issues in a more integrative fashion.

A MORE INTEGRATED EXCHANGE THEORY

While George Homans was involved in an effort to create a microreductionistic exchange theory, Richard Emerson sought to create a more integrated version of that theory. He published two related essays written in 1972 that had a profound effect on the development of exchange theory. Three basic factors served as the impetus for this new body of work. First, Emerson was interested in exchange theory as a broader framework for his earlier interest in power and dependence. It seemed clear to Emerson that power was central to the exchange theory perspective. Second, Emerson felt that he could use behaviorism (operant psychology) as the base of his exchange theory but avoid some of the problems that had befallen Homans. Homans and other exchange theorists had been accused of assuming an overly rational image of human beings, but Emerson felt he could use behaviorism without assuming a rational actor. In addition, Emerson felt he could avoid the charge of
